Diskcopy is a script to backup your floppy disks to the hard drive. Some floppy disks are not very reliable, so it is a good idea to have a backup. Diskcopy can make a backup of all disks. If you want a backup of only a specific floppy disk, Diskcopy can do that too. Diskcopy is an advanced version of RARkit. Diskcopy is the main program for RARkit. RARkit is a script that combines several programs together. Diskcopy has been tested with hard disks from 1.44 to 2.88 MB in size. Diskcopy is also designed to run with a DOS prompt, so you can also run it in DOS in a window. Diskcopy is part of the RARkit distribution. To get a copy of RARkit and Diskcopy, you can download the complete installation package for free from RARkit website. Diskcopy Acknowledgements: Diskcopy is a product of Hsoft Inc, Helsinki, Finland Diskcopy is based on the code of RARkit written by Peter T. What is Diskcopy? Diskcopy is a powerful tool which allows you to copy data from one partition/diskette to another. To use it, simply give the source diskette type to diskcopy (you can use '-' for any type of diskette) and the destination diskette type and the amount of disks to be copied (number of disks to be copied and total disks to copy). Diskcopy will try to copy the data to a destination diskette. Diskcopy currently supports disk copies for almost any diskette type including 160 Kb, 180 Kb, 320 Kb, 360 Kb, 720 Kb, 1.2 MB, 1.44 MB and 2.88 MB disks, using XMS, EMS, buffers or swap file. On top of that diskcopy supports the use of image files. Get Diskcopy and take it for a spin to see what it can actually do for you! What's New In Diskcopy?

Diskcopy can copy diskettes with known logical and physical parameters, such as sector and track sizes. Requirements: Diskcopy is primarily designed to copy disks with non-standard (segmentation or track width) physical parameters to discs with similar standard parameters. The diskette may be copied from a diskette containing a boot sector, MSDOS Partition table or FAT16/32 file system. Thus disks which are not known to diskcopy can also be copied. Diskcopy can also copy over file systems like FAT16/32. Usage: diskcopy [-p] [-s] [-i] [-f] [-r] [-b] [-w] [-il-e] [-F] [-d] [-n] [-l] [-s] [-v] [-y] [-h] [-c] [disclimage] [disclimage]... -p Print progress messages to the console and display status information. -s Switch to display character set "CP437". -i Input file name. The default file is "INPUT.INPUT". -f Output file name. The default file is "OUTPUT.OUTPUT". -r Default sector and track size. The default value is assumed when no other value is given. -b Write the current logical sector size and track size to the first output file. -w
